

Fast-RCNN论文阅读笔记

前言

SPPnet虽然解决了重复计算feature map 和固定size问题,但是还是存在较多的问题:训练是分为多个步骤,每个步骤的特征和数据要储层起来,需要较大的储存,目标检测时还是较慢.spp无法反向传播

1.Fast-RCNN的改进

1. Higher detection quality (mAP) than R-CNN, SPPnet
2. Training is single-stage, using a multi-task loss
3. Training can update all network layers
4. No disk storage is required for feature caching

2.Fast-RCNN的结构

frCNN是将整个图片和ss选出的region propose一起输入网络中,经过conv层提出feature map,将ROI对应的特征图送入ROI pooling统一尺寸,接着fc层分为两个支路,一个是softmax分类,一个是Bbox回归。

Figure 1. Fast R-CNN architecture. An input image and multiple regions of interest (RoIs) are input into a fully convolutional network. Each RoI is pooled into a fixed-size feature map and then mapped to a feature vector by fully connected layers (FCs). The network has two output vectors per RoI: softmax probabilities and per-class bounding-box regression offsets. The architecture is trained end-to-end with a multi-task loss.

ROIpooling其实就是spp,只是他一级的金字塔化,每个RoI是一个元组 (n, r, c, h, w) , n 是特征映射的索引, $n \in \{0, \dots, N-1\}$, (r, c) 是RoI左上角的坐标, (h, w) 是高与宽。输出是max-pool过的特征映射, $H' \times W' \times C$ 的大小, $H' \leq H, W' \leq W$ 。对于RoI, $\text{bin-size} \sim h/H' \times w/W'$, 这样就有 $H'W'$ 个输出bin, bin的大小是自适应的, 取决于RoI的大小。

3.Fast-RCNN的训练

pre-trained network 也是同样的采用了一些imagenet分类中的一些训练好的网络,由于roi pooling 采用的是一级金字塔,那么反向传播时梯度是可以通过roi pooling,训练时就可以同时更新convh和fc层
Multi-task loss.多个任务统一loss,那就可以一起训练了。

$$L(p, u, t^u, v) = L_{\text{cls}}(p, u) + \lambda[u \geq 1]L_{\text{loc}}(t^u, v), \quad (1)$$

in which $L_{\text{cls}}(p, u) = -\log p_u$ is log loss for true class u .

The second task loss, L_{loc} , is defined over a tuple of true bounding-box regression targets for class u , $v = (v_x, v_y, v_w, v_h)$, and a predicted tuple $t^u = (t_x^u, t_y^u, t_w^u, t_h^u)$, again for class u . The Iverson bracket indicator function $[u \geq 1]$ evaluates to 1 when $u \geq 1$ and 0 otherwise. By convention the catch-all background class is labeled $u = 0$. For background RoIs there is no notion of a ground-truth

bounding box and hence L_{loc} is ignored. For bounding-box regression, we use the loss

$$L_{\text{loc}}(t^u, v) = \sum_{i \in \{x, y, w, h\}} \text{smooth}_{L_1}(t_i^u - v_i), \quad (2)$$

in which

$$\text{smooth}_{L_1}(x) = \begin{cases} 0.5x^2 & \text{if } |x| < 1 \\ |x| - 0.5 & \text{otherwise,} \end{cases} \quad (3)$$

is a robust L_1 loss that is less sensitive to outliers than the L_2 loss used in R-CNN and SPPnet. When the regression targets are unbounded, training with L_2 loss can require careful tuning of learning rates in order to prevent exploding gradients. Eq. 3 eliminates this sensitivity.

The hyper-parameter λ in Eq. 1 controls the balance between the two task losses. We normalize the ground-truth regression targets v_i to have zero mean and unit variance. All experiments use $\lambda = 1$.

训练过程采用了SVD降维来加快速度

4.结果

训练熟读明显加快了,测试mAP有几个点的提高

5.总结

fast-rcnn比较的完美,实现了从头到尾的一步训练,加快了速度和减少了储存量.
